Experiment No. 9
Implement Non-Restoring algorithm using c-programming
Name: Umang Borse
Roll Number: 03
Date of Performance:
Date of Submission:

Aim - To implement Non-Restoring division algorithm using c-programming.

Objective -

- To understand the working of Non-Restoring division algorithm.
- To understand how to implement Non-Restoring division algorithm using c-programming.

Theory:

In each cycle content of the register, A is first shifted and then the divisor is added or subtracted with the content of register A depending upon the sign of A. In this, there is no need of restoring, but if the remainder is negative then there is a need of restoring the remainder. This is the faster algorithm of division.

Program -

```
#include <stdio.h>
```

```
#include <stdlib.h>
```

```
int dec_bin(int, int []);
```

```
int twos(int [], int []);
```

```
int left(int [], int []);
```

```
int add(int [], int []);
```

```
int main()
```

```
{
```

```
    int a, b, m[4]={0,0,0,0}, q[4]={0,0,0,0}, acc[4]={0,0,0,0}, m2[4], i, n=4;
```

```
    printf("Enter the Dividend: ");
```

```
    scanf("%d", &a);
```

```
    printf("Enter the Divisor: ");
```

```
    scanf("%d", &b);
```

```
    dec_bin(a, q);
```

```
    dec_bin(b, m);
```

```
    twos(m, m2);
```

```
    printf("\nA\tQ\tComments\n");
```

```
    for(i=3; i>=0; i--)
```

```
    {
```

```
        printf("%d", acc[i]);
```

```
    }
```

```
    printf("\t");
```

```
    for(i=3; i>=0; i--)
```

```
    {
```

```
        printf("%d", q[i]);
```

```
    }
```

```
    printf("\tStart\n");
```

```
    while(n>0)
```

```
    {
```

```
        left(acc, q);
```

Department of Artificial Intelligence & Data Science

0000 010_ A=A-M

0000 0101 Q₀=1

Quotient = 0101 Remainder = 0000

Conclusion -

This experiment and the code implementation of the Non-Restoring Division Algorithm have offered valuable insights into the realm of binary division. We have showcased the algorithm's efficiency in dividing binary numbers without resorting to restoration operations, making it well-suited for hardware implementations where optimal performance is essential. This experiment has not only highlighted the effectiveness of algorithmic improvements in digital computation but has also demonstrated the real-world utility of non-restoring division as a dependable approach for achieving accurate binary division in a hardware setting.
